SUBJECT: Experimental Parliament-Type Cigarettes

Attached is a summary of the analytical data we obtained on the experimental Parliament-type cigarettes supplied by the Manufacturing Department. The data are based on a random sample, with each cigarette code being smoked on every machine load. Each machine load also included monitor cigarettes, CI Parliaments, and CI Kents. The TPM for the monitors averaged 24.0 mg/cigt. (target 24.2), the Parliaments 25.1 (CI value 25.0), and the Kents 22.3 (CI value 22.8). The TPM and nicotine data in the attached summary are average values based on sixteen machine loads. The RTD data are averages of at least 50 cigarettes and the static burning times are averages of thirty determinations.
